

# STOCK POND PROPOSED RESTORATION

January 2006

- The stock Pond will be excavated and graded to remove sediment and to rebuild dam.
- This dam will include a weir to allow for timely draining after California red-legged frog breeding and larval development in the late summer and early fall. This function will also help park rangers control the water level of the pond and control bullfrog breeding as they require 24+ months to breed successfully.
- Re-seeding and planting with native vegetation.
- A boardwalk will be constructed at the Stock Pond to allow for public observation and pond monitoring management.
- Trail realignment to avoid fragile wetland area and cross new dam instead.
- Installation of an educational interpretation signage panel to describe the habitat being observed at the Stock Pond.
